

Section 36: Sylow Theorems

Def: Let X be a set and G a group. An *action* of G on X is a map $*$: $G \times X \rightarrow X$ such that

1. $ex = x$ for all $x \in X$.
2. $(g_1g_2)(x) = g_1(g_2x)$ for all $x \in X$ and all $g_1, g_2 \in G$.

Under these conditions, X is a G -set.

Orbit Equation: The major results in this section come from counting the number of elements in a finite G -set. We can get the size of the set X with the equation

$$|X| = |X_G| + \sum_{i=s+1}^r |Gx_i|$$

where $X_G = \{x \in X | gx = x, \forall g \in G\}$ is the union of the one-element orbits in X and the Gx_i 's are the orbits with more than one element.

Thm. Let G be a group of order p^n and let X be a finite G -set. Then $|X| \equiv |X_G| \pmod{p}$.

Def: Let p be a prime. A group G is a p -group if every element in G has order a power of the prime p . A subgroup of a group G is a p -subgroup of G if the subgroup is itself a p -group.

Cauchy's Theorem: Let p be a prime. Let G be a finite group and let p divide $|G|$. Then G has an element of order p and, consequently, a subgroup of order p .

Corollary: Let G be a finite group. Then G is a p -group if and only if $|G|$ is a power of p .

Def: The subgroup $G_H = \{g \in G | gHg^{-1} = H\}$ where H is a subgroup of G is the *normalizer* of H in G and will be denoted $N[H]$.

Lemma: Let H be a p -subgroup of a finite group G . Then

$$(N[H] : H) \equiv (G : H) \pmod{p}$$

Corollary: Let H be a p subgroup of a finite group G . If p divides $(G : H)$, then $N[H] \neq H$.

First Sylow Theorem: Let G be a finite group and let $|G| = p^n m$ where $m \geq 1$ and where p does not divide m , then

1. G contains a subgroup of order p^i for each i where $1 \leq i \leq n$.
2. Every subgroup H of G of order p^i is a normal subgroup of a subgroup of order p^{i+1} for $1 \leq i < n$.

Def: A *Sylow p -subgroup* of a group G is a maximal p -subgroup of G , that is, a p -subgroup contained in no larger p -subgroup.

Second Sylow Theorem: Let P_1 and P_2 be Sylow p -subgroups of a finite group G . Then P_1 and P_2 are conjugate subgroups of G .

Third Sylow Theorem: If G is a finite group and p divides $|G|$, then the number of Sylow p -groups is congruent to 1 modulo p and divides $|G|$.
